

Softclose 50

Softclose 50 is an ingenious device that will slow down a sliding door weighing upto **50kg** and gently close it over the last 110mm of travel. Being compact you could also mount a 2nd unit to the door so that it slows down at the final 110mm of opening as well.

Due to it's simple design you can mount the softclose unit to various door types, both as newbuild or retro fitting to an existing sliding door.

The most popular fitting method is to position the closer on top of the door in between the sliding door hangers. The catch can then be fitted to a static point, usually the wall or timber packer.

The diagram below shows you how the catch is engaged with the locator when the door is in the closed position. By mounting the components based on this diagram you should find it easy to install.

An alternative fitting method is to have the closer mounted on the wall with the catch on the side of the door. This may be preferable should there not be enough space between the top of the door and the sliding door track.

Screws for mounting the softclose unit to the door and the catch to a static surface are supplied by others as fixing materials can vary.
