

# Finger Protection

## Blind Action and Rearguard Type

These products are not solely for use where children are present, they are an extremely useful product, where there is a possibility that someone may inadvertently place their hands near the hinge side of the door.

Doors are used every day by everybody but they are potentially dangerous and according to RoSPA (the Royal Society for the Prevention of Accidents) there are over 30,000 finger injuries every year.

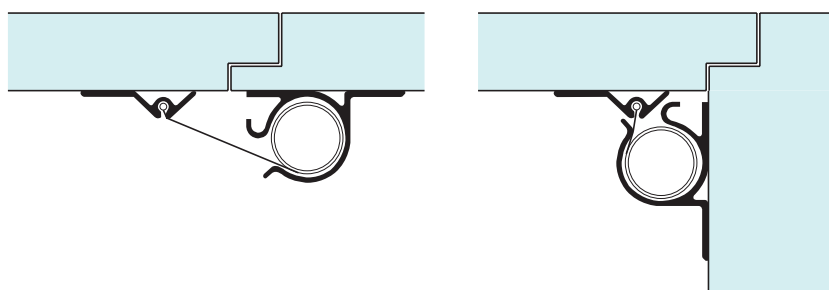

Teachers, parents and carers have become increasingly aware of the danger to people, mainly children, trapping their fingers in closing doors and to avoid accidents recent legislation (BS 7036 Part 4: item 7.1) recommends "the use of a finger defender that either fills the finger trap or minimises the gap so as not to create a finger trap".

### Blind action finger guard

This is a high quality, resilient blind which prevents fingers entering the cavity formed between the edge of the door and the frame. The blind is mounted in a robust aluminium housing, unlike a concertina style blind which is constantly exposed and can suffer damage as a result. A robust housing protects the blind when not in use.

Independently tested to over 1 million opening and closing cycles it prevents fingers entering the cavity formed between the door and door frame by means of a non-inflammable blind, which opens and closes with the action of the door.

The robust housing protects the blind when not in use. It has concealed screw fixings and comes complete with end caps for an even neater finish.
